Problems While Integrating Back-end

Dashboard Page

1. Could not find an **announcement** model or service. The closest match was `HmnzNote` model and **Note** service.

2. **Generate Reports** feature not implemented yet. Need clarification on:

   - Expected report format/design

   - Exact data and fields that should be included

Employee Profile Page

1. The field **bank account name** is missing from `HmnzEmployee` model (could potentially reuse `employee_name` if intended).

2. Fields for **Passport Section** and **Social Info Section** are missing from the `HmnzEmployee` model.

Requests

1. Could not find a **requests** model or service. Closest match was related to **employee leaves**, which appears to be part of another module.

Schedule

1. Found multiple relevant models and services, but unclear which one should be used for integration.

Payroll

1. Same issue as Schedule — multiple models and services found, but they don't fully match the required fields.

2. `HmnzSalarySlip` and `HmnzEmployeeIncentive` cover most of the fields, but some fields in the form have no clear mapping in these models.

3. There should be an option to **generate a salary slip** and **send it through email** — need clarification whether:

   - This should be handled in the backend using an existing service (PDF generation + email sending)

   - Or generated on the frontend and sent via a backend email API

Recruitment

1. Models and services found, but some fields in the recruitment form do not match the available model fields.

2. There should be an option to **generate an offer letter** and **send it through email** — need clarification whether:

   - This is handled fully in the backend using a dedicated service (template + email)

   - Or partially handled in the frontend with backend support for email sending
